Vision: 7/7

- Vision summary
- Vision statement
- Does it conform with the interview?

The vision statement is quite well thought of and according to the description provided by the client in the interview.

Planning: 7.5/8

- Big user stories for all iterations
- Detailed user stories for iteration 1
- Does it follow the preferences of the customer based on the interview?

The user stories look well worked on. However, user stories are generally written in high level for understanding; abstracting technical details, then they are broken down in to detailed user stories or tasks for the development team to work on. Moreover, a good way of organizing them is to group with area. For instance the user stories "Add Tasks" and "Add Course Information" can be assigned an area "Course Management" so that you don't overlap or duplicate a requirement/task or a portion of it in more than one user story. The following issues were found with the submission.

- It wasn't specified which iteration user stories belong to (backlog). So, it wasn't clear which big stories were broken down to detailed stories for first iteration.

- Cost of detailed user stories can't be traced back to big user stories. The idea of detailed user stories is that they are break downs of big user stories, so if a big story is broken down into 3 or 4 detailed user stories their accumulated cost should be equal to the cost of the big story.

Good work overall. Best of luck for the implementation.
